AI Overview

A peer-to-peer (P2P) network uses a **decentralized overlay topology** built on top of physical connections. In this setup, every device (peer) acts as both a client and a server, sharing files, processing power, or bandwidth directly without a main central server. Wikipedia +3

Types of P2P Network Topologies

P2P overlay topologies group into three main functional categories based on how nodes link and locate data: YouTube · Network Encyclo…

- **Unstructured P2P Topology**
  - Peers connect randomly.
  - New nodes link with nearby existing peers.
  - Searches flood or broadcast across neighbors until found.
  - *Example:* Early Gnutella. YouTube · Polimi OpenKno…
- **Structured P2P Topology**
  - Peers follow a specific, organized geometric layout (like a ring or grid).
  - Data items map to specific nodes using Distributed Hash Tables (DHT).
  - Searches route efficiently and predictably through deterministic paths.
  - *Example:* BitTorrent's DHT, Chord. YouTube · Jakob Jenkov +2
- **Hybrid P2P Topology**
  - Combines decentralization with a central index.
  - A central server tracks *where* data lives, but files transfer directly peer-to-peer.
  - *Example:* Early Napster.

Peer-to-Peer Architecture Explained (How It Really Works)

1 month ago

YouTube · Topictrick

If you'd like, let me know:

- Are you designing a **file-sharing application**, a **blockchain/crypto project**, or an **IoT system**?
- Do you need help choosing between an **unstructured** or **structured** layout?
